Attending Provider Notes

Provider: Dr Mateo Jackson, PhD

Patient: John Doe

35 yo M c/o stomach problems since last 2 months. Patient reports epigastric abdominal pain non-radiating. Pain is described as gnawing and burning, intermittent lasting 1-2 hours, and gotten progressively worse. Antacids used to alleviate pain but not anymore; nothing exacerbates pain. Pain unrelated to daytime or to meals. Patient denies constipation or diarrhea. Patient denies blood in stool but have noticed them darker. Patient also reports nausea. Denies recent illness or fever. He also reports fatigue in the last 2 weeks ago and bloating after eating.

ROS: Negative except for above findings

Meds: Motrin once/week. Tums previously.

PMHx: Back pain and muscle spasms. No Hx of surgery.

NKDA.

FHx: Uncle has a bleeding ulcer.

Social Hx: Smokes since 15 yo, 1/2-1 PPD. No recent EtOH use. Denies illicit drug use. Works on high elevation construction. Fast food diet. Exercises 3-4 times/week but stopped 2 weeks ago.

RE: **EXAMINEE** : John Doe
CLAIM NUMBER : 12345-67890
DATE OF INJURY : April 20, 2003
DATE OF EXAMINATION : August 26, 2003
EXAMINING PHYSICIANS : Mateo Jackson, DC

Prior to the beginning of the examination, it is explained to the examinee that this examination is intended for evaluative purposes only, and that it is not intended to constitute a general medical examination. It is explained to the examinee that the traditional doctor-patient relationship does not apply to this examination, and that a written report will be provided to the agency requesting this examination. It has also been emphasized to the examinee that he should not attempt any physical activity beyond his tolerance, in order to avoid injury.

CHIEF COMPLAINTS: Improved focal lower back pain.

HISTORY: John Doe is a 26-year-old man who immigrated to this country approximately six years ago. He speaks "un poquito" English and an interpreter is provided. He has worked for the last four years at Floragon Forest Products, where he normally functions as a "stacker." He indicates that another worker was on vacation, and because of this he was put on another job in which he separated logs using a picaroon. He was doing this on April 20, 2003, and was pulling on the picaroon when it gave way, and he fell backwards landing on a metal step, which was approximately 1 foot off of the ground. He demonstrates that he came down square on the step and did not fall backwards or hyperextend over it. He did not hit his upper back or neck or shoulders, and only sat down on the step as described. He had "a little" pain in his back at that time, but was able to get up and continue working. He completed his shift that day and returned to work the following day. He had the next two days off. He says that his symptoms persisted and increased, and on April 25, 2003, he went to the First Choice Physicians Chiropractic and Rehab Clinic, where he came under the care of Dr. Márcia Oliveira, DC. The file contains an entrance form completed by Mr. John Doe which indicates at the bottom under "previous occurrence of the same pain" a notation of "Yes, but it was not really the same, it was just a little and tolerable." There is an additional note on the side which states "no pain prior to this injury or on that day, occasional (but low back)." Saw this notation, he says today that he did not state this and that the form was done by "Edna" at Dr. Márcia Oliveira's office.

Mr. John Doe was initially treated three times a week and states that this has now been reduced to twice per week. He does not know how long the chiropractic treatment is to continue. Initially, he has been seen by Dr. Kwaku Mensah on three occasions, the last being on August 15, 2003. Dr. Kwaku Mensah has basically referred him back to Dr. Márcia Oliveira for continued chiropractic management.

Mr. John Doe has now returned to his normal job as a stacker and is able to do that with no significant increased pain. He does mention, however, that bending over, picking up anything particularly heavy is bothersome; however, he does not normally have to do that. He denies any new

Surgical Pathology Report

Patient: Doe, John
MRN: A11-8-199878
DOB: 07/08/1971
Gender: M

Accession Number: AF123456
Procedure: 03/15/2020
Attending: Dr. Mateo Jackson, MD

Clinical History: Large Gastric Mass

Specimen: Gastric Mucosa

Diagnosis

Stomach, Partial Gastrectomy:

- Malignant Epithelioid Gastrointestinal Stromal Tumor
- Tumor Size 10 x 9 x 8 cm
- Cell Type: Epithelioid and Spindled
- High cellularity; present
- Mucosal Invasion: Focally present adjacent to ulceration
- Mucosal ulceration present
- Mitotic Count: 10/50 HPF
- Myxoid background: Focally present
- Foci of necrosis present
- CD117, vimentin, and CD34: uniformly positive

Gross Description

The specimen consists of an approximately 5 x 7 cm portion of gastric mucosa that is surrounded and underlying by a lobulated mass which is 10 x 9 x 8 cm. The central portion of the mass appears to have an approximately 1.5-cm ulcer. The mucosa away from the area of ulceration is partially removed from the underlying tumor. The underlying mass appears encapsulated and lobular. Gross sections show the lesion to consist of several different patterns. A single area has a gray to gray-tan pattern with an area of central necrosis showing a fairly uniform appearance whereas; other regions of the tumor are gray white- and somewhat lobular in appearance. Areas of yellow necrosis are scattered through the tumor. Representative portions submitted.

Microscopic Description

Sections through the neoplasm show it to be primarily a high cellular neoplasm. The cells are in part arranged in fascicles and clusters with enlarged elongate nuclei having relatively fine nucleoli. In some areas, the fascicles have an interwoven appearance. Mitotic figure up to 10:50 HPF. A few areas show foci of necrosis with the cells appearing to be surrounded by somewhat myxoid stroma. Foci of displayed necrosis are present. The lesions appear circumscribed, although not specifically encapsulated. It focally involved the mucosa and shows full thickness ulceration. The tumor immediately beneath the mucosal area of ulceration has a nearly lobular somewhat spindled growth pattern. Some areas of the tumor have a slightly more rounded nuclei and somewhat epithelioid appearance. The cells appear to be arranged in groups and clusters. Some of the cells have cytoplasmic vacuoles. These areas also show a prominent mitotic activity. Some mitotic figures are abnormal and atypical. The tumor contains numerous relatively open vascular channels which appear to be part of the neoplasm. The tumor has a pseudo capsule and in some areas appear to be nearly covered.

Immunostains are strongly positive for CD117 (C-kit), CD34, and Vimentin, Smooth muscle actin, Desmin, Synaptophysin, S-100, and Ck8/18 are negative.

Comment

Immunostains were performed on the core biopsy and demonstrate that the tumor cells are positive for CD117. The findings are consistent with the above diagnosis.
